

Your Chicks' 4 ½ Month

You're probably anxiously awaiting the "fruits of your labors", fresh eggs! You've gotten your pullets off on the right foot by providing excellent care and nutrition for them during the past several months. Now is the time to introduce your laying pullets to **Purina Mills Layena® Sunfresh® Recipe** to insure that they receive the best nutrition to support egg production.

- Gradually transition your laying pullets over to **Purina Mills Layena® Sunfresh® Recipe** over a 7-10 day period.
- Continue to provide birds with a maximum of 17-18 hours of light per day to insure optimum egg production.
- **Purina Mills Layena® Sunfresh® Recipe** can be purchased as a pellet, crumble or mash. All 3 forms contain high quality grains with added vitamins and minerals for a complete and balanced diet. In pelleted form, it is just that, a pellet. Crumbles are simply pellets that are broken apart into smaller bits which make it easier to eat. Mash is broken into even smaller pieces to make a "meal".
- Optimum egg production is achieved when layers are maintained in temperatures between 65°F and 85°F. As temperatures increase above this, egg size decreases. Keep your birds cool and comfortable so you will get the best return on your investment!
